

emme — demo cheat sheet

med-hack-template.vercel.app

What we built

- An intake flow that collects someone's health plan details so Emme can work out what their care costs.
- Upload your insurance PDF and it fills the form in, or skip it and type it yourself. Both always available.

What we used

- TypeScript — the whole thing
- React + Next.js — the app and the one API endpoint
- Tailwind CSS + shadcn/ui — styling and components
- Node.js — the PDF reader (built it ourselves, no library)
- Vercel — hosting
- No database. Answers save in the browser, so you can close it and come back.

Demo order

- Landing page — show the confusing statement next to the plain-English version
- Start form, upload sample-eob-synthetic.pdf
- 12 fields fill in. Question count drops 21 to 13 — pause and let them see it
- Scroll a section: every question says why we're asking. Tap 'I don't have this'
- Reload the page — everything's still there
- Finish, show the summary explaining their plan in plain English
- Tap 'Show me the raw data' for the JSON

Q&A

Is it really reading the PDF?

Yes. It searches the text for labels like 'Deductible' and grabs the number next to it. No AI, no API key.

Is that a real insurance document?

No, we made it. Says so on the document itself. We're not using real patient data.

What about privacy / HIPAA?

Nothing is stored on a server. It all stays in your browser. Real version would need proper auth and encryption.

Why doesn't it show what care will cost?

We asked Emme — that's their engine's job. We collect the inputs for it.

What if the PDF doesn't work?

It tells you and you type it in instead. Never a dead end.

How does it handle more insurance companies?

One file lists all the questions. Add to that file and the whole app updates. No UI changes.

What's not finished?

Validation is basic. The cost section is long and people would probably drop off there. We haven't tested with real users.

Who did what?

Aaryan built the app and the form. Shreyas built the PDF extraction. Others on copy, research and the pitch.

If it breaks

- Skip the upload — the manual path needs no internet
- Have a screen recording on the phone as backup

All numbers in the demo are made up. No real patient data anywhere.
